

Queen's University Research Study
Kingston, Ontario, Canada

Action Observation and Eye Gaze

Goal: To increase understanding of how adults with an ASD understand their own and other people's movements, as well as how eye gaze works in adults with ASD.

Who can participate?

- High- or low-functioning adults over 18 years of age with a diagnosed ASD who can follow simple instructions and repeat them back
- Typically developing adults over 18 years of age

What is involved?

This study consists of multiple parts. These may include watching another person performing a task, watching a video, completing hands-on tasks and/or answering a series of questions. During some of the tasks, your eye movements will be recorded using an eye movement tracker. The study will involve between one to three visits that will be 45 minutes to an hour in duration. Please do not feel obligated to participate in all of the visits. You will be reimbursed \$10.00 for every visit to the lab that you make.

In addition, ASD Studies is in the process of initiating new research projects for participants of all ages. We would appreciate hearing from any parents/caregivers of one or more children/adolescents with ASD and well as adults diagnosed with ASD.
